ABSTRACT:

PROBLEM TO BE SOLVED: To extremely improve productivity of a useful substance such as an antibody, a vector for gene therapy, cytokinin, an antigen for vaccine, etc., by transducing an apoptosis inhibitory gene to an animal cell capable of producing a useful substance.

SOLUTION: An apoptosis inhibitory gene such as bcl-2, BAG-1, Bcl-XL, Ad.Elb or Crma is transduced to bcl-2 transduced COS-1 cell (FERM P-15,808) as an animal cell capable of producing a useful substance by an electroporation method. A selective pressure is applied to the system to select a gene-transduced cell, which is cultured in a medium to mass produce a useful substance such as various antibodies produced by a hybridoma, a virus vector for treating a gene, various recombinant protein such as a cytokine, e.g. interferon, an antigen substance for a vaccine, etc., in improved productivity.
